

COMP 322 Internet Systems Fall 2007 Assignment 6

Due in the digital drop box by Friday, Nov. 30 at 11:00 PM

1. Write an HTML document that takes orders of some interesting form (other than that of the example in the Course Notes). When the form is submitted, the order is sent as form data to a PHP script that writes the order to file. Another PHP script reads and outputs the file's contents in groups of two lines (blank line after each pair of lines) and numbers the lines.
2. Write an HTML document with checkboxes for student attendance and text boxes for student scores. The correspondence is between the value for the checkbox and the name for the text box. Write a PHP document that takes the form data for this and makes an associative array (student names and scores) of the students in attendance. Operating on this array, find the highest, lowest, and average scores. Also, output the key-value associations well-formatted in a table.
